

Synchro material distributor

Innovative conveying systems

* VHV – uniform distribution
across the entire effective width

Synchro material distributor

Hinged without having to disassemble the mixer plates

Advantages when using the VHV Synchro:

- * Intermeshing mixer plates distribute a concentrated material flow evenly across a larger effective width
- * Subsequent systems are loaded with a uniform width
- * Hot products, such as foundry sand, cool down more easily thanks to the larger surface. It is easier to add water to a product that absorbs water.
- * The material flow can be distributed evenly
- * Speed adjustments optimise the distribution based upon different types of material
- * Designed with a hinged frame, the mixer plates lift off the belt without damaging it.
